Preface	xiii
1 Tree growth and wood quality	1
RODNEY ARTHUR SAVIDGE	
1.1 Cambial growth	1
1.1.1 Wood is a biosynthetic end product	1
1.1.2 Zonation	1
1.1.3 Bordered-pit development	3
1.1.4 Secondary-wall lamellae	4
1.1.5 Microfibrils and lignin	5
1.1.6 Protoplasmic autolysis	5
1.1.7 Cambial fusiform cell length and orientation	6
1.2 Perennial cambial growth	6
1.2.1 Episodic but variable cambial growth	6
1.2.2 Tapering to the point in form and function	7
1.3 Wood quality in perspective	8
1.3.1 Defining wood quality	8
1.3.2 Measuring wood quality	8
1.3.3 Wood quantity versus wood quality	9
1.3.4 Stem dimensions and quality	9
1.3.5 G×E control of wood quality	9
1.3.6 Variation <i>taraplas</i> within the tree	12
1.4 Wood density	14
1.4.1 Molecular and anatomical basis	14
1.4.2 Enhancing wood density through silviculture	14
1.4.3 Enhancing wood density through tree improvement	16
1.4.4 Understanding the control of secondary-wall formation at the level of cell biology	18
1.5 The larger picture	19
1.5.1 An abundance of wealth	19
1.5.2 The consumer is always right	21
1.5.3 The technology of wood-quality assessment can be flawed	21
1.6 Discussion: seeing the wood and the trees	22
1.6.1 Philosophical and historical musings	22

1.6.2	Wood quality measured on a three-pan balance	23
1.6.3	Lignin on the three-pan balance	23
1.6.4	Looking back	24
1.6.5	Looking forward	26
	References	26
2	Wood anatomy in relation to wood quality	30
	BRIAN G. BUTTERFIELD	
2.1	Wood anatomy	30
2.1.1	Softwoods and hardwoods	30
2.1.2	Growth rings	32
2.2	The cell wall of softwood tracheids	34
2.2.1	Cell wall structure	34
	2.2.1.1 The middle lamella	35
	2.2.1.2 The primary wall	36
	2.2.1.3 The secondary wall	37
2.2.2	Cell wall and density	37
2.2.3	Microfibril angle	38
	2.2.3.1 Determination of microfibril angle	38
	2.2.3.2 Microfibril angle variation and its effect on wood properties	40
2.3	The cell wall in hardwood fibres and vessel elements	43
2.3.1	Fibres	43
2.3.2	Vessels	43
2.4	Cell wall pits and perforations	45
2.4.1	Pits	45
2.4.2	Perforations	48
2.5	Vessel-less angiosperms	48
	Acknowledgements	49
	References	49
3	Wood chemistry in relation to quality	53
	HELENA PEREIRA, JOSÉ GRAÇA and JOSÉ C. RODRIGUES	
3.1	Introduction	53
3.2	Chemical composition of wood	54
3.2.1	Cell wall structural components	55
	3.2.1.1 Cellulose	55
	3.2.1.2 Hemicelluloses	60

3.2.1.3	Lignin	64
3.2.1.4	Distribution in the cell wall	68
3.2.2	Extractive components	71
3.2.2.1	Terpenoid extractives	72
3.2.2.2	Phenolic extractives	74
3.2.2.3	Other wood extractives	76
3.3	Variation of chemical composition	76
3.3.1	Juvenile wood	79
3.3.2	Heartwood	79
3.3.3	Reaction wood	80
3.3.4	Knotwood	81
3.4	Wood chemical quality parameters depending on end-use	81
	References	83
4	Wood density and growth	87
	PEKKA SARANPÄÄ	
4.1	Importance of wood density	87
4.2	Density of cell wall material	87
4.3	Determination of density	90
4.3.1	Water displacement method	90
4.3.2	X-ray densitometry	91
4.4	What causes variation in density?	92
4.4.1	Within growth ring	93
4.4.2	Within a tree	97
4.4.3	Between sites	101
4.5	Is there a correlation between density and growth rate?	102
4.5.1	Effect of fertilisation on growth rate and wood density	109
4.6	Conclusions	113
	References	113
5	Reaction wood	118
	JOHN R. BARNETT and GEORGE JERONIMIDIS	
5.1	Introduction	118
5.2	Early studies of reaction wood formation	121
5.3	Induction of reaction wood formation	122
5.3.1	The role of auxin	122
5.3.2	The role of ethylene	124
5.3.3	The role of gibberellins	124
5.3.4	The role of stress	124

5.4	Structure and formation of reaction wood	125
5.4.1	Compression wood	125
5.4.2	Tension wood	128
5.4.3	Opposite and lateral wood	132
5.5	Reaction wood and wood quality	132
	References	134
6	Growth stresses	137
	BERNARD THIBAUT and JOSEPH GRIL	
6.1	Origin of growth stresses	137
6.1.1	Geometric and mass growth: support stress	137
6.1.2	Cell differentiation: maturation stress	137
6.1.3	Growth stresses	139
6.1.4	Role of growth stresses	140
6.1.5	General models of growth stresses	140
6.2	Measurement of growth stresses	141
6.2.1	In situ peripheral measurement	141
6.2.2	Measurement of residual stresses in logs	142
6.2.3	Main results for normal maturation strain	142
6.2.4	Growth stresses and reaction wood	144
6.3	Consequence of growth stresses for quality	147
6.3.1	Log-end cracks	147
6.3.2	Lumber distortion	149
6.3.3	Reaction wood	150
6.4	Prediction and treatment	151
6.4.1	Tree and log morphology	151
6.4.2	Consequences of cutting operations	153
6.4.3	Observation of reaction wood	153
6.5	Conclusions	154
	References	154
7	Wood quality for pulp and paper	157
	DENILSON DA SILVA PEREZ and THIERRY FAUCHON	
7.1	Introduction	157
7.1.1	Why wood?	157
7.1.2	Wood versus non-wood fibres	158
7.2	From wood to paper	160
7.2.1	Wood as a raw material	160
7.2.2	Wood–pulping process interactions	161
7.2.3	Wood–pulp fibre relationships	164

7.3	Resource management and biological decay	165
7.3.1	Origin, supply of resources and pulp production	165
7.3.2	Biological decay	166
7.3.3	Mill specifications and quality control measurement	170
7.4	Wood-quality variability and its consequences for pulp and paper quality	173
7.4.1	Wood species and mixtures	173
7.4.2	Within- and among-tree property variation	179
7.4.2.1	Within-ring variation	179
7.4.2.2	Radial trends	180
7.4.2.3	Variations from the base to the top	181
7.4.3	Forestry practice, site index and growth conditions	183
7.5	The future	184
	References	184
8	The mechanical properties of wood	187
	AUDREY ZINK-SHARP	
8.1	Introduction	187
8.2	Advantages and disadvantages of wood as a structural material	188
8.2.1	Advantages	189
8.2.1.1	High strength and flexural rigidity in spite of light weight	189
8.2.1.2	Available and renewable resource	189
8.2.1.3	Requires less energy to process into structural material	189
8.2.1.4	Ease of fabrication and conversion	190
8.2.1.5	Dimensionally stable and durable if used correctly	190
8.2.1.6	Low electrical, thermal, and acoustical conductivity	190
8.2.2	Disadvantages	190
8.2.2.1	Variability	190
8.2.2.2	Natural built-in defects	191
8.2.2.3	Dimensional instability	191
8.2.2.4	Susceptibility to biological attack	191
8.2.2.5	Anisotropy	191
8.2.2.6	Combustibility	192
8.3	Importance of density	192
8.4	Mechanical properties important for structural applications	194
8.4.1	Elastic properties	194
8.4.2	Strength properties	196

8.5	Creep effects on deformation and fracture	198
8.6	Defects affecting mechanical properties	199
8.6.1	Naturally occurring defects: knots and sloping grain	199
8.6.1.1	Knots	199
8.6.1.2	Sloping grain	200
8.6.2	Processing defects: checks and splits	203
8.6.2.1	Checks	203
8.6.2.2	Splits	203
8.7	Problems with mechanical joints	204
	References	209
